If the primes are finite, then all of them divide the number one

We propose a novel proof of the infinitude of the primes based on elementary considerations of Legendre’s function $\phi$, defined in [1, p. 153] as

$$\phi(x, y) = |\{1 \leq n \leq x : \text{integer } n \text{ has no prime factors } \leq y\}|,$$

where $x$ and $y$ are positive integers. The reader can see that

$$\pi(x) = \pi(x, y) + \phi(x, \sqrt{x}) - 1,$$

where $\pi(\cdot)$ is the prime-counting function. Let $p_1, \ldots, p_s$ be the prime numbers less than or equal to $y$. Using the inclusion-exclusion principle, it can be proved that

$$\phi(x, y) = x - \sum_{1 \leq i \leq s} \left\lfloor \frac{x}{p_i} \right\rfloor + \sum_{1 \leq i, j \leq s} \left\lfloor \frac{x}{p_ip_j} \right\rfloor + \ldots + (-1)^s \left\lfloor \frac{x}{p_1 \cdots p_s} \right\rfloor,$$

where $\lfloor \cdot \rfloor$ is the floor function. Pinasco [2] also used this principle for proving the infinitude of the primes, but his proof is remarkably different from ours.

Suppose that $\{p_1, \ldots, p_s\}$ is the set of all prime numbers. Consider $N = p_1 \cdots p_s$. Then $\phi(N^2, N) = 1$. On the other hand, we have

$$\phi(N^2, N) = N^2 - \sum_{1 \leq i \leq s} \left\lfloor \frac{N^2}{p_i} \right\rfloor + \sum_{1 \leq i, j \leq s} \left\lfloor \frac{N^2}{p_ip_j} \right\rfloor + \ldots + (-1)^s N.$$

Hence, $\phi(N^2, N) = mN$ for some integer $m$, i.e., every prime number divides 1. This means that all primes, and, consequently, all non-zero natural numbers, are invertible in $\mathbb{N}$, i.e., we find that $\mathbb{N}$ is a field. This completes the proof.
