## 1. SUPPLEMENTARY TEXT

## Complete Material and Methods

## EzrA Structure Modeling

The amino acid sequence of $\operatorname{EzrA}(S p n)$ containing only the cytoplasmic portion (amino acids 30 -end) were entered into the phyre ${ }^{2}$ server under "normal modeling" (Kelley et al., 2015). The alignment of $\operatorname{EzrA}(S p n)$ with $\operatorname{EzrA}(B s u)$ (pdb accession number is 4UXV, "Cytoplasmic domain of bacterial cell division protein EzrA"). The resulting PDB model was visualized and aligned in PyMOL (The PyMOL Molecular Graphics System; Version 1.7.4.3; Schrödinger, LLC 2; www.pymol.org).

## Bacterial Strains and Growth Conditions

Bacterial strains used in this study were derived from strain IU1824; unencapsulated derivative of serotype $2 S$. pneumoniae strain D39 containing an allele conferring Streptomycin resistance ( $r p s L 1$ ) or IU1945 (streptomycin sensitive; $\left.r p s L^{+}\right)(($Lanie et al., 2007); Supplementary Table 1). Strains containing antibiotic resistance markers were constructed by transforming linear DNA amplicons synthesized by overlapping fusion PCR into competent pneumococcal cells as described previously (Tsui et al., 2010). Primers used for the generation of amplicons are listed in Supplementary Table 2. All constructs were confirmed by DNA sequencing of chromosomal regions corresponding to the amplicon region used for transformation. Bacteria were grown in plates containing trypticase soy agar II (modified; Beckton-Dickson) and $5 \%(\mathrm{v} / \mathrm{v})$ defribrinated sheep blood (TSAII-BA). Plates were incubated at $37^{\circ} \mathrm{C}$ in an atmosphere of $5 \% \mathrm{CO}_{2}$. For antibiotic selections, TASII-BA plates contained $250 \mu \mathrm{~g}$ kanamycin $\mathrm{ml}^{-1}, 150 \mu \mathrm{~g}$ spectinomycin $\mathrm{ml}^{-1}, 0.3 \mu \mathrm{~g}$ erythromycin $\mathrm{ml}^{-1}, 250 \mu \mathrm{~g}$ streptomycin $\mathrm{ml}^{-1}$, or $0.25 \mu \mathrm{~g}$ tetracycline $\mathrm{ml}^{-1}$. Strains were cultured statically in Becton-Dickinson brain heart infusion (BHI) broth at $37^{\circ} \mathrm{C}$ in an atmosphere of $5 \% \mathrm{CO}_{2}$, and growth was monitored by $\mathrm{OD}_{620}$ as described before (Land et al., 2013; Tsui et al., 2014). Bacteria were inoculated into BHI broth from frozen cultures or colonies, serially diluted into the same medium, and propagated for 1216 h . For growth experiments (non-depletion strains), overnight cultures that were still in exponential phase $\left(\mathrm{OD}_{620}=0.1-0.4\right)$ were diluted back to $\mathrm{OD}_{620} \approx 0.001-0.012$ to start final cultures, which lacked antibiotics in BHI broth at $37^{\circ} \mathrm{C}$ in an atmosphere of $5 \% \mathrm{CO}_{2}$. Cells were grown in $\mathrm{C}+\mathrm{Y} \mathrm{pH}$ 6.9-7.1 in an atmosphere of $5 \% \mathrm{CO}_{2}$ only when indicated in specific figure legends (Supplementary Figure 5, 14, and 27A).

## Growth Merodiploid strains and Zn-Dependent Depletion

In all experiment that utilize $\mathrm{ZnCl}_{2}$ for Zn -dependent ectopic gene expression (including EzrA and FtsZ depletion and EzrA overexpression strains), indicated amounts of $\mathrm{ZnCl}_{2}$ were used alongside $1 / 10 \mathrm{MnSO}_{4}$ to prevent $\mathrm{ZnCl}_{2}$ toxicity in growth media and on TSAII-BA plates (Jacobsen et al., 2011; Tsui et al., 2014; Tsui et al., 2016). Depletion strains requiring $\mathrm{ZnCl}_{2}$ for growth were grown overnight in BHI broth in the presence of $0.5 \mathrm{mM} \mathrm{ZnCl}_{2}$ and $0.05 \mathrm{mM} \mathrm{MnSO}_{4}$ for EzrA depletion strains or $0.3 \mathrm{mM} \mathrm{ZnCl}_{2}$ and 0.03 mM MnSO 4 for FtsZ depletion strains. To deplete EzrA or FtsZ, cells grown to $\mathrm{OD}_{620} \approx 0.1-0.25$ in the presence of $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$, were collected by centrifugation ( 5 min at $16,000 \times g$ at $25^{\circ} \mathrm{C}$ ), and re-suspended to appropriate $\mathrm{OD}_{620}$ in BHI with or without $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$, such that cell density at the indicated collection time point(s) was between $\mathrm{OD}_{620} \approx 0.075-0.25$. The resuspension $\mathrm{OD}_{620}$ was 0.036 or 0.012 , for 1 h or $2-4 \mathrm{~h}$ collection time points, respectively. Cells were collected at appropriate time intervals and cell density for live
cell imaging, fixation for immunofluorescence microscopy (IFM), phase contrast microscopy, FDAA labelling, LIVE/DEAD staining, or western blotting experiments.

## Cell Fixation and Adherence to Coverslips for Fluorescence Microscopy (Fm)

Cell fixation and adherence to coverslips was performed as described previously (Tsui et al., 2016). Briefly, after exponentially growing cells $\left(\mathrm{OD}_{622} \approx 0.075-0.25\right)$ had been washed in cold $\left(4^{\circ} \mathrm{C}\right) \mathrm{PBS}$ and pelleted, supernatant was removed and pellet was re-suspended in 1 mL of $4 \%$ paraformaldehyde (EMS; 157-4) and incubated for 15 min at room temperature, followed by 45 min on ice. Fixed cells were centrifuged ( 5 min at $16,000 \times g$ at $4^{\circ} \mathrm{C}$ ), and pellets were washed three times with cold $\left(4^{\circ} \mathrm{C}\right)$ PBS at $4^{\circ} \mathrm{C}$ as described above. After the third wash and centrifugation, cells were resuspended in $0.1-0.3 \mathrm{~mL}$ of cold $\left(4^{\circ} \mathrm{C}\right)$ GTE buffer ( 50 mM glucose, 1 mM EDTA, 20 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.5$ ), and stored in the dark at $4^{\circ} \mathrm{C}$ for up to 16 h . All samples that were fixed, with the exception of vertically oriented cells, were prepared on coverslips and were treated with methanol as described previously for direct imaging or processing for IFM (Tsui et al., 2016).

## Characterization of Antibodies for IFM

Antibodies used and incubations used varied per experiment and have shown to be optimal for antibody labeling (Land et al., 2013; Tsui et al., 2014; Tsui et al., 2016) and are listed in Supplementary Table 5. DNA in nucleoids was stained using mounting media SlowFade gold antifade reagent with DAPI (Life Technologies, S36936). Control experiments showed no detectable antibody labelling in cells not expressing tagged proteins (IU1824 or IU1945) with the combinations of antibodies used, with exception of anti-FtsZ (data not shown). Labelling of strains containing single tagged-proteins were tested with the double labelling procedure (that contained both sets of primary and secondary antibodies) and produced signal in the expected fluorescence channel only (data not shown).

## Analysis of 2D-Epifluorescence Microscopy (EFm) Images

Localization of FLAG-, Myc-, and HA-tagged proteins by IFM (Tsui et al., 2014) or localization of sfGFP, GFP, HT by single frame imaging of live cells was performed for exponentially growing cells as described before (Perez et al., 2019).

Following 2D-image acquisition of pneumococcal cells, images were aligned and cells were individually picked and were manually binned into four division stages (pre-, early-, mid-, and latedivisional) using a point-and-click IMA-GUI organized in MATLAB as reported previously (Land et al., 2013; Tsui et al., 2014).

Demographs showing protein fluorescence intensity as a function of cell length were generated by using Microbe J (version 5.11s) as described using previous parameters that allow for inclusion of stage 4 cells in the analysis (Perez et al., 2019). For these experiments only live cells were visualized that had been acquired by single frame imaging.

## 3D-SIM IFM

Samples were prepared as described previously (Land et al., 2013; Tsui et al., 2014) and 3D-SIM was performed using the OMX 3D-SIM super resolution system located in the Indiana University Bloomington Light Microscopy Center (LMIC). Exposure times and \%T settings for DAPI, Alexa-

488, and Alexa 568 images were $10-100 \mathrm{~ms}$ and $50 \%$, 50 ms and $1-10 \%$, and 50 ms and $10-50 \%$ respectively.

## TIRF Microscopy (TIRFm)

TIRFm was performed on cells grown in $\mathrm{C}+\mathrm{Y} \mathrm{pH} 6.9-7.1$ at $37^{\circ} \mathrm{C}$ and imaged on $\mathrm{C}+\mathrm{Y}$ agarose pads as described previously (Perez et al., 2019) with 1 frame aquired per second and with 45 ms exposure times. Strain numbers, relevant strain features, and laser power used (\% Transmission or $\% \mathrm{~T}$ ) for the indicated excitation laser wavelength are indicated; IU15768 (FtsZ-sfGFP EzrA-HT ${ }^{\mathrm{JF549}}$ ) $10 \% \mathrm{~T}$ at 488 nm and $50 \%$ T at 561 nm ; IU15699 (GFP-FtsA EzrA-HT ${ }^{\mathrm{JF} 549}$ ) 100\% T at 488 nm and $50 \% \mathrm{~T}$ at 561 nm ; IU9985 (FtsZ-sfGFP) 10\% T at 488 nm ; IU14131 ( $\Delta z a p A$ FtsZ-sfGFP) $10 \% \mathrm{~T}$ at 488 nm . HaloTag proteins were labelled to saturation with 500 nM HT-JF549 ligand (Grimm et al., 2015).

## 3D-SIM of FDAA-Labeled Cells Expressing EzrA-sfGFP

To image vertically oriented cells of strain IU10254 (EzrA-sfGFP) we performed 3D-SIM on samples prepared similarly described in (Perez et al., 2021). Cells from overnight cultures were diluted to $\mathrm{OD}_{620} \approx 0.02$ in 2 mL of fresh BHI broth. At $\mathrm{OD}_{622} \approx 0.22,575 \mu \mathrm{~L}$ of cultures was centrifuged at $16,100 \times g$ for 5 min at room temperature, and pellets were resuspended in $250 \mu \mathrm{~L}$ of BHI broth containing TADA ( $125 \mu \mathrm{M}$ final). Cells were incubated at $37^{\circ} \mathrm{C}$ for 5 min , chilled on dry ice for 20 s , and centrifuged for 2.5 mm at $16,100 \times g$ at $4^{\circ} \mathrm{C}$. Cell pellets were centrifuged and washed twice with $500 \mu \mathrm{~L}$ ice-cold PBS, then centrifuged a third time and resuspended in $500 \mu \mathrm{~L}$ of $4 \%(\mathrm{v} / \mathrm{v})$ paraformaldehyde and incubated in the dark for 15 min at room temperature, followed by 45 min on ice in the dark. Fixed cells were centrifuged, and pellets were resuspended in $100 \mu \mathrm{~L}$ of ice-cold GTE buffer ( 50 mM glucose, 20 mM Tris-HCl, pH 7.5, 1 mM EDTA). For imaging, cells were centrifuged for 5 min at $16,100 \times g$ at $4^{\circ} \mathrm{C}$ to remove the GTE buffer and centrifuged once more to remove residual GTE buffer with a P20 pipette. Excess liquid was allowed to evaporate for approximately 1 min before pellets were resuspended in $3.0 \mu \mathrm{~L}$ of Vectashield Hardset Antifade (Vector Laboratories, $\mathrm{H}-1400$ ) with vortexing $1.2 \mu \mathrm{~L}$ of resuspended cells was pipetted onto a 12 $\mathrm{mm} / 1.5$ round coverslip (EMS, 72230-01), and a microscope slide was carefully placed on top. The slide was incubated coverslip side down at room temperature in the dark for 15 min , and then viewed by 3-Dimensional Structured Illumination Microscopy (3D-SIM). Exposure time and \%T settings to acquire images were 5 ms and $50 \%$ for TADA and sfGFP.

## Measurements of Cell Dimensions by Phase-Contrast Microscopy (PCm)

Live cells were used for PCm and cell length and width measurements. Cells were grown in BHI broth in the presence or absence of $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$ using Nikon NIS-Element AR software as described before (Land et al., 2013). For all strains, either stage one cells or daughters of stage four cells were analyzed. Length was defined as the long-axis of post divisional (daughters of stage 4 cells) or stage one cells, while width was parallel planes of daughter cells. Aspect ratio was determined by dividing length by width. The relative volume of cells was determined by dividing the width ${ }^{2} \mathrm{x}$ length of an individual cell by median width ${ }^{2} \mathrm{x}$ length value of wild-type strain (IU1945).

## Western Blotting

Cell were obtained from exponentially growing cultures. Total cell lysates were prepared using SEDS ( $0.1 \%$ deoxycholate, $150 \mathrm{mM} \mathrm{NaCl}, 0.2 \%$ SDS, 15 mM EDTA pH 8.0) lysis buffer as
described previously (Beilharz et al., 2012; Cleverley et al., 2019). FLAG-, HA-, and Myc-tagged proteins were detected by western blot using 1:1000 dilution of anti-FLAG rabbit polyclonal antibody (Sigma, F7425), anti-HA rabbit polyclonal antibody (Invitrogen, 71-5500), anti-GFP rabbit (ThermoFisher \#A11122), or anti-Myc rabbit polyclonal antibody (Sigma, C3956) as primary antibodies for 1 hr incubations. Native untagged proteins were detected using anti-FtsZ at 1:10000 (Lara et al., 2005), anti-FtsA at 1:10000 (Lara et al., 2005), or anti-MreC at 1:5000 (Land and Winkler, 2011) as primary antibodies for 1 h incubations. Secondary incubations were performed using HRP Donkey anti-rabbit for 1 h at a 1:10000 ratio. Chemiluminescent signal in protein bands was detected and quantified using an IVIS imaging system as described previously (Wayne et al., 2010). Following imaging and data acquisition of immunoblot, India-ink was used to confirm equal amount of cell lysate loading throughout all lanes of the nitrocellulose membrane, briefly, $10 \mu \mathrm{~L}$ of india ink was added to 10 mL of PBST and allowed to incubate with used-nitrocellulose membrane overnight. The membrane was then washed with 6 mL of PBS for 5 min twice to remove excess india ink.

## LIVE/DEAD Staining of ezrA and Other Mutants

Viability determinations were done using the LIVE/DEAD BacLight bacterial viability kit (Molecular Probes) as described before in (Sham et al., 2013; Wayne et al., 2012) with slight modifications. With this assay, a mixture of SYTO 9 and propidium iodide stains bacteria with intact cell membranes and bacteria with damaged membrane fluorescent green and red respectively. Briefly, strains (Supplementary Table 3 and Supplementary Figure 29) were grown at $37^{\circ} \mathrm{C}$ overnight and depletion or complementation occurred as described above in "Growth of Zn dependent Depletion and Merodiploid strains". At appropriate times indicated in respective figure legends, cells were collected by centrifugation at $16,100 \mathrm{x} g$ for 2 min at $25^{\circ} \mathrm{C}$. Cell pellets were resuspended in $50 \mu \mathrm{~L}$ of BHI broth by gentle pipetting to which $2 \mu \mathrm{~L}$ of a $1: 1(\mathrm{v} / \mathrm{v})$ mixture of Syto- 9 and propidium iodide was added, according to the manufacturer's instructions, by gentle pipetting. The staining mixture was incubated in the dark for 5 min at $25^{\circ} \mathrm{C}$, and cells were visualized by PCm and EFm as described previously (Wayne et al., 2012).

## DAPI Staining for Nucleoid Content

DNA in nucleoids was stained using mounting media SlowFade gold anti-fade reagent with DAPI (Life Technologies, S36936) (Tsui et al., 2014; Perez et al., 2019). Briefly, cells were grown in BHI under appropriate conditions. At the indicated times, cells were fixed as described in "Cell fixation and cell adherence to coverslips for fluorescence microscopy." Immediately prior to imaging $3 \mu \mathrm{~L}$ of DAPI (Life Technologies, S36936) was added to the adhered cells, and coverslips were sealed onto glass slides and visualized immediately. Cells were then scored based on the presence or absence of DAPI staining to give values in Supplementary Table 4.

## FDAA Pulse-Chase Labeling in Depletion Experiments

FDAAs HADA (7-hydroxycoumarin-3-carboxylic acid 3-amino-D-alanine), and TADA (tetramethylrhodamine 3-amino D-alanine) were synthesized as reported previously (Boersma et al., 2015; Perez et al., 2021). Cells from exponentially growing cultures were spun and re-suspended to an $\mathrm{OD}_{620}$ between $0.01-0.036$ in 2 or 3 mL of warmed BHI broth $( \pm \mathrm{Zn})$ containing $1.0 \mu \mathrm{~L}$ of 500 mM HADA (in dimethyl sulfoxide [DMSO]) to a final concentration of $250 \mu \mathrm{M}$. At appropriate time intervals $500 \mu \mathrm{~L}$ of cell were transferred to a 2.0 mL centrifuge tube, which were placed in an ice bath for 1 min to halt labeling and centrifuged for 5 min at $16,000 \mathrm{xg}$ at $4^{\circ} \mathrm{C}$. Supernatants were
discarded, and pellets were resuspended in $250 \mu \mathrm{~L}$ of warm $\mathrm{BHI}(-\mathrm{Zn})$ which contained pre-warmed TADA in DMSO to a final concentration of $500 \mu \mathrm{M}$. Cultures were placed back into an incubator and grown at $37^{\circ} \mathrm{C}$ for indicated time amounts in Supplementary Figure legends 12A, and 19A. Cultures were then placed in an ice bath for 1 min to halt labeling and centrifuged for 2.5 min at $16,000 \times g$ at $4^{\circ} \mathrm{C}$. Cultures were then centrifuged at $16,000 \times g$ for 2.5 min at $4^{\circ} \mathrm{C}$, supernatants discarded, and pellets were re-suspended in $250 \mu \mathrm{~L}$ of cold 1 X PBS. After the second wash and centrifugation, pellets were re-suspended in 1 mL of $4 \%$ paraformaldehyde (EMS; 157-4) for fixation as described above for "Cell Fixation and Cell Adherence to Coverslips for Fluorescence Microscopy."

## Co-Immunoprecipitation (Co-IP) Assays

Co-IP experiments involving crosslinking steps were performed as described previously (Rued et al., 2017). Briefly, washed cell pellets of FLAG-tagged or control non FLAG-tagged strains grown in 400 mL BHI broth were crosslinked in $0.1 \%$ paraformaldehyde for 1 h at $37^{\circ} \mathrm{C}$, washed, resuspended in cold lysis buffer ( 50 mM Tris- $\mathrm{HCl} \mathrm{pH} 7.4,150 \mathrm{mM} \mathrm{NaCl}, 1 \mathrm{mM}$ EDTA, $1 \%$ Triton X100 (w/v)) with protease inhibitor (ThermoFisher Scientific), and shaken in a FastPrep homogenizer (MP Biomedical). 4 mg proteins and anti-FLAG magnetic beads (Sigma) were incubated for 2 h at $4^{\circ} \mathrm{C}$, washed, and complexes containing FLAG-tagged proteins were eluted with FLAG elution buffer containing 150 ng FLAG3 peptide/ $\mu \mathrm{L}$. Input sample and eluted sample were mixed with equal volumes of $2 \times$ Laemmli sample buffer (Bio-Rad) containing $5 \%$ (vol/vol) $\beta$ mercaptoethanol (Sigma) and heated at $95^{\circ} \mathrm{C}$ for 1 h to break the cross-links. $5 \mu \mathrm{~L}$ or $20 \mu \mathrm{~L}$ of input samples or eluted samples were loaded into each lane of $4-15 \%$ precast protein gels (Bio-Rad) in Tris-glycine buffer. Transferred membranes were subjected to Western blotting using anti-FLAG (Sigma), anti-HA (ThermoFisher Scientific), anti-Myc (Sigma), anti-FtsZ, anti-FtsA, and anti-MreC as primary antibody as described above.

Co-IP experiments not involving crosslinking was performed in Figure 1C with strains IU10447 and IU5456 as described above with the omission of paraformaldehyde incubation.

## Bacterial Two-Hybrid (B2H) Assays

The hybrid plasmids used in the B2H assays are listed in Supplementary Table 6. For cloning, the target genes were amplified by PCR from S. pneumoniae D39 chromosomal DNA using the primers listed in Supplementary Table 7. PCR fragments for $\operatorname{sep} F, m p g A$ (formerly $m g l t G(S p n)$, $\operatorname{rod} Z$, $\operatorname{rod} A$, ftsW, ftsQ/divIB, ftsL, ftsB/divIC, macP, ftsK, zapA, zapJ, and mreD were purified, digested with the appropriate restriction enzymes, and cloned into the corresponding sites of the pKT25/pUT18C or pKNT25/pUT18 vectors to generate plasmids encoding the corresponding hybrid proteins fused at their C-terminal ends of the T25/T18 fragments (sepF, mpgA, rodZ, rodA, ftsW, ftsQ/divIB, ftsL, $f t s B / d i v I C, \operatorname{macP}, f t s K, z a p A, z a p J$ ) or at their N-terminal ends the of the T25/T18 fragments (mreD), respectively. E. coli $\mathrm{DH} 5 \alpha$ or XL1-blue transformants were selected on LB agar plates containing ampicillin ( $100 \mu \mathrm{~g} / \mathrm{ml}$ ) or kanamycin $(50 \mu \mathrm{~g} / \mathrm{mL})$ and $0.4 \%$ glucose to repress leaky expression (Karimova et al., 2005). The correct sequence of each construct was verified by double-strand sequencing using primers also listed in Supplementary Table 7. The hybrid plasmids pKT25-ftsA/pUT18C-ftsA, pKNT25-ftsZ/pUT18-ftsZ, pKNT25-gpsB/pUT18-gpsB, pKNT25-stkP/pUT18stkP, pKNT25-ezrA/pUT18-ezrA, pKT25-pbp1a/pUT18C-pbp1a, pKT25-pbp2a/pUT18C-pbp2a, pKT25-pbp2x/pUT18C-pbp2x, pKT25-pbp2b/pUT18C-pbp2b and pKT25-mreC/pUT18C-mreC were previously constructed and reported (Krupka et al., 2012; Rued et al., 2017; Cleverley et al.,
2019). The B2H plasmids pKNT25-locZ and pUT18-loc $Z$ were kindly provided by K. Buriánková and P. Branny. Plasmid pairs pKNT25/pUT18 and pKT25-zip/pUT18C-zip were used as negative and positive controls, respectively. B2H assays were carried out as previously described (Rued et al., 2017; Cleverley et al., 2019). Briefly, each pair of plasmids was co-transformed into the E. coli cyastrain BTH101 and co-transformation mixtures were spotted directly onto LB agar plates supplemented with ampicillin ( $100 \mu \mathrm{~g} / \mathrm{ml}$ ), kanamycin ( $50 \mu \mathrm{~g} / \mathrm{mL}$ ) and X-Gal ( $60 \mu \mathrm{~g} / \mathrm{ml}$ ), followed by incubation at $30^{\circ} \mathrm{C}$. Plates were inspected and photographed after 24 h and 40 h . All the B2H experiments were performed at least twice.

## Mass Spectrometry to Identify ZapJ (Spd_1350)

Co-IP with crosslinking was performed on strains IU1824 and IU10267 as described above with following changes. $50 \mu \mathrm{~L}$ (instead of $20 \mu \mathrm{~L}$ ) of the eluted sample was loaded onto an SDS-PAGE gel. Silver staining was performed as described by manufacturer's instructions (Pierce ${ }^{\mathrm{TM}}$ C\# 24612). The indicated bands in Figure 11A were cut from gels, destained, and submitted to the IUB Mass Spectrometry facility for Trypsin digests and Mass Spectrometry as described previously (Sham et al., 2011). Results from mass spectrometry indicated that Spd_1350 (ZapJ) peptides were not detected in $\mathrm{ZapA}^{+}$control sample and were the most enriched peptides in the ZapA-FLAG sample compared to the $\mathrm{ZapA}^{+}$control.

${ }^{\text {a }}$ Strains were constructed as described in Materials and Methods and above.
${ }^{\text {b }}$ Primers used to synthesize fusion amplicons are listed in Supplementary Table 2.
${ }^{c}$ Linkers and tags are annotated as described below. FLAG-tagged (FLAG), c-Myc-tagged (Myc), and HA-tagged (HA) fusions were made to the carboxyl-end of all tagged proteins. The amino acid sequences of the FLAG, Myc, and HA epitope tags are DYKDDDDK (Hopp et al., 1988, Wayne et al., 2010), EQKLISEEDL (Evan et al., 1985), and YPYDVPDYA (Wilson et al., 1984), respectively. FLAG ${ }^{\mathrm{n}}$ indicates n tandem sequences of the FLAG epitope, DYKDDDDK. $\mathrm{L}_{0}$ for to a 10-amino-acid spacer linker (GSAGSAAGSG) (Waldo et al., 1999; Wayne et al., 2010)). L1 linker sequence in $g f p-\mathrm{L}_{1}-m a p Z$ is LEGSG (Fleurie et al., 2014). The DNA template for $g f p$ is $\mathrm{pUC} 57-g f p(S p)$ (Martin et al., 2010), which was codon optimized for S. pneumoniae and contains aa substitution (A206K) to prevent GFP dimerization. L2-linker sequence in $f t s Z-L_{2}-g f p$ is KLDIEFLQ (Fleurie et al., 2014). Superfolder GFP ( $s f g f p$ ) is from (Kjos et al., 2015). rfp referred to as mKate2 and is a far red
monomeric fluorescent protein with codon optimized for S. pneumoniae (Beilharz et al., 2015). L4 sequence in ZapA tagged proteins is RSIAT (Pazos et al., 2013). Ls sequence in HlpA tagged proteins is GSGSGGEAAAKGS (Kjos et al., 2015). HaloTag ( $h t$ ) is codon optimized for S. pneumoniae (Perez et al., 2019). FtsZ-L5-CFP-erm is from (van Raaphorst et al., 2017).
${ }^{\mathrm{d}}$ The indicated strains were constructed and grown in the presence of $0.3 \mathrm{mM} \mathrm{ZnCl}{ }_{2}$ and 0.03 $\mathrm{mM} \mathrm{MnSO}_{4}$ (for $f$ ts Z conditional mutants) or $0.5 \mathrm{mM} \mathrm{ZnCl}_{2}$ and $0.05 \mathrm{mM} \mathrm{MnSO}_{4}$ (for ezrA conditional mutants).
${ }^{\mathrm{e}}$ Antibiotic resistance markers: Erm ${ }^{\mathrm{R}}$, erythromycin; Kan $^{\mathrm{R}}$, kanamycin; $\mathrm{Spc}^{\mathrm{R}}$, spectinomycin; $\operatorname{Str}^{\mathrm{R}}$, streptomycin; $\mathrm{Cm}^{\mathrm{R}}$, chloramphenicol; $\mathrm{Tet}^{\mathrm{R}}$, tetracycline.

${ }^{\text {a }}$ Genomic DNA of indicated S. pneumoniae strains was used as templates for PCR reactions. Strain genotypes are listed in Supplementary Table 1, unless noted below.
${ }^{\mathrm{b}} \mathrm{IU} 4888$ (D39 $\left.\Delta c p s ~ \Delta g p s B<>a a d 9 / / b g a A^{\prime}:: \mathrm{P}_{f c s K}-g p s B^{+}\right)($Land et al., 2013)
${ }^{\text {cIU }} 6397$ (D39 rpsL1 $\Delta p h o U 2$ bgaA' $:: k a n-t 1 t 2-\mathrm{P}_{f t s A-p h o U 2+}$ ) (Zheng et al., 2016)
${ }^{\mathrm{d}}$ IU7426 (D39 $\left.\Delta c p s ~ p b p 2 b-\mathrm{HA}^{4}-\mathrm{P}_{\mathrm{c}}-k a n\right)$ (Tsui et al., 2014)
${ }^{\text {e}}$ IU3966 (D39 bgaA' ::tet-PZn-GFP-divIVA). Amplicon was templated from pJWV25 (Eberhardt et al., 2009).
${ }^{\mathrm{f}} \mathrm{p} U C 57-g f p(S p)$ (Martin et al., 2010)
${ }^{\mathrm{g}} \mathrm{P}_{\mathrm{c}}$-erm and $\mathrm{P}_{\mathrm{c}}$-kan-rpsL ${ }^{+}$cassettes are described in (Tsui et al., 2011).
${ }^{\mathrm{h}}$ Amplicons from IU7814 or IU5795 containing $\Delta f t s Z:$ :aad9 or $\Delta e z r A \gg$ aad 9 were used for transformation experiments to test for essentiality. These alleles were amplified with the respective outside primers.

Supplementary Table 3. Percent live cells during EzrA depletion determined by Live/Dead staining

| Strain and condition ${ }^{\mathrm{a}}$ |  | Percent live $^{\mathrm{b}}$ | $\mathrm{n}^{\mathrm{c}}$ |
| :--- | :--- | :---: | :---: |
| D39 $\Delta c p s$ | -Zn | $96.0 \pm 0.5 \%$ | 188 |
| D39 $\Delta c p s \Delta e z r A / / \mathrm{P}_{\mathrm{Zn}}-e z r A^{+}$ | +Zn 2 h | $92.8 \pm 6.2 \%$ | 189 |
|  | -Zn 2 h | $89.6 \pm 9.5 \%$ | 261 |
|  | -Zn 3 h | $93.0 \pm 0.4 \%$ | 212 |
|  | -Zn 7 h | $96.7 \pm 1.4 \%$ | 210 |

${ }^{\text {a }} \mathrm{D} 39 \Delta c p s$ (IU1945), D39 $\Delta c p s \Delta e z r A / / \mathrm{P}_{\mathrm{Zn}}-e z r A^{+}$(IU8799), were grown in the presence $(+\mathrm{Zn})$, or absence of $(-\mathrm{Zn})$ supplemented $\mathrm{ZnCl}_{2} / \mathrm{MnSO}_{4}$ for the indicated amount of time, as described in Materials and Methods. For viewing at 7 h time point, initial $\mathrm{OD}_{620}$ was $\approx 0.002$. Live/Dead staining occurred as described in Materials and Methods.
bPercent survival is determined by total cells stained as "live" divided by "live+dead," averaged from two separate experiments $\pm$ SEM.
${ }^{\mathrm{c}} \mathrm{n}=$ number of cells analyzed. Data is from two biological replicates in which n is between 80-161 cells per replicate. Cells were analyzed from at least 4 separate fields per experiment. Cells which showed no labeling ( $>2 \%$ ) were excluded from the analysis.

Supplementary Table 4. Percent anucleate cells determined by DAPI staining

| Strain and condition ${ }^{\text {a }}$ |  | Percent anucleate $^{\mathrm{b}}$ | ${ }^{\mathrm{c}} \mathrm{n}=$ |
| :--- | :--- | :---: | :---: |
| D39 $\Delta c p s$ | -Zn | 0 | 400 |
| D39 $\Delta c p s \Delta e z r A / / \mathrm{P}_{\mathrm{Zn}}-e z r A^{+}$ | +Zn 2 hr | $0.25 \pm 0.25 \%$ | 400 |
|  | -Zn 4 hr | $3.25 \pm 0.75 \%$ | 400 |
| D39 $\Delta c p s \Delta m a p Z:: \mathrm{P}_{\mathrm{c}}-\left[k a n-r p s L^{+}\right]$ | -Zn | $0.5 \pm 0 \%$ | 400 |

${ }^{\mathrm{a}} \mathrm{D} 39 \Delta c p s$ (IU1945), D39 $\Delta c p s \Delta e z r A / / \mathrm{P}_{\mathrm{Zn}}-e z r A^{+}$(IU8799), D39 $\Delta c p s \Delta m a p Z:: \mathrm{P}_{\mathrm{c}}-[k a n-$ $r p s L^{+}$] (IU9711), were grown in the presence $(+\mathrm{Zn})$ or absence $(-\mathrm{Zn})$ of $0.5 \mathrm{mM} \mathrm{ZnCl}_{2}$ and 0.05 mM $\mathrm{MnSO}_{4}$ for the indicated amount of time. Depletion and fixation for DAPI staining were performed as described in Materials and Methods.
${ }^{\mathrm{b}}$ Percent anucleate was determined by the presence of DAPI labeling in the cell. $\pm$ indicated the SEM.
${ }^{c} \mathrm{n}=$ number of cells analyzed. Data were obtained from biological replicates in which n is 200 pre-divisional cells or daughters of post-divisional cells per replicate. Cells were analyzed from at least 2 separate fields per experiment.

Supplementary Table 5. Antibody labeling conditions used for IFM in this study ${ }^{\text {a }}$

4. SUPPLEMENTARY FIGURES AND LEGENDS

O PG hydrolytic remodeling enzymes

Supplementary Figure 1

Supplementary Figure 1. Schematic summary of cell division and peptidoglycan (PG) synthesis in S. pneumoniae (Spn) and genetic arrangement, protein topology, and 3D-overlayed structure with $\operatorname{EzrA}(B s u)$ for $\operatorname{EzrA}(S p n)$ (A) Schematic drawing of the cell cycle of S. pneumoniae focusing on PG synthesis and FtsZ-ring localization throughout a cell cycle. (B) Schematic diagram of genes surrounding ezrA in the $S$. pneumoniae D39 chromosome. The genes encode the following proteins: spd_0708 (uncharacterized putative protein); spd_0709, gyrB (DNA gyrase subunit-B); spd_0710 (ezrA), and spd_0711 (uncharacterized putative protein IS30 element). Genes of same color are predicted to be in the same operon using DOOR analysis (Dam et al., 2007; Mao et al., 2009; Mao et al., 2014). Genetic arrangement of spd_0708-0710, but not necessarily the predicted operons, are conserved in all streptococci species tested (S. pyogenes M1 GAS, S. thermophilus LMG 18311, S. parasanguinis FW213). (C) 2D-analysis of $\operatorname{EzrA}(S p n)$ protein secondary structure using SMART tool (Letunic et al., 2015; Ponting et al., 1999; Schultz et al., 1998). $\operatorname{EzrA}(S p n)$ is predicted to have 4 coiled-coiled regions as well as the designated QNR motif at the C-terminus. (D) EzrA(Spn) 3D-structure lacking the first 29 (transmembrane) residues was predicted using phyre ${ }^{2}$ software then threaded onto the known crystal structure of $\operatorname{EzrA}(B s u)$ (Cleverley et al., 2014). $\operatorname{EzrA}(B s u)$ is predicted to have 5 spectrin repeats, whose location is surrounding the red numbers (Spectrin repeats 1-5). The essential QNR motif (amino acids 510-516) is shown at the top right corner in orange, then rotated $180^{\circ}$ in the box to the left. (E) Model for the intracellular organization of EzrA dimers in B. subtilis.

$\Delta \operatorname{mapZ}$ (IU9723)

B I. IU9713; mapZ ${ }^{+}$

Stage $1 / n=67 \quad 2 / n=49 \quad 3 / n=6$

II. IU9723; $\Delta m a p Z$

Stage $1 / n=122 \quad 2 / n=49 \quad 3 / n=48 \quad 4 / n=24$

C

Supplementary Figure 2. Co-localization of FtsZ- and EzrA-rings in wild-type or $\Delta m a p Z S p n$ mutants. (A) 2D Representative phase and fluorescence images of strain IU9713 (ftsZ-Myc ezrA-HA) and IU9723 ( $\Delta$ mapZ ftsZ-Myc ezrA-HA) grown in BHI to mid exponential phase $\left(\mathrm{OD}_{620} \approx 0.1-0.2\right)$ prepared for IFM as described in Materials and Methods. Data were obtained from two independent biological replicates. (B) Averaged images with fluorescence intensity traces showing FtsZ and EzrA localization in wild-type or $\Delta m a p Z$ cells. Cells were binned into division stages 1-4, and images from the indicated number of cells ( $n$ ) from at least two independent biological replicates were averaged using IMA-GUI program as described in Materials and Methods. For stage 1-4 cells, the Z- and EzrA-band were placed so that the shorter distance to the pole was on the right half of the chart, resulting in fluorescence intensity distributions being biased toward one cell half. Row 1 , cell shapes determined from phasecontrast images; row 2, nucleoid locations from DAPI labeling; row 3, EzrA locations from IFM; row 4, FtsZ locations from IFM; row 5, normalized mean fluorescence intensity distributions along the horizontal cell axis for each channel (black, phase image; blue, DNA; green, EzrA; red, FtsZ). Data were obtained from two independent biological replicates. (C) Scatter plot of the paired widths from the same cells of FtsZ and EzrA fluorescent immunolabeled regions at the actively dividing septa of strain IU7223 at division stages 1-3. Width measurements and plotting were done using IMA-GUI program (see Materials and Methods). Statistical analysis was performed as described previously (Tsui et al., 2014) where ** and ${ }^{* * *}$ indicate $\mathrm{P}<0.01$ and $\mathrm{P}<0.001$ respectively. Septal widths of stage 4 cells were not analyzed, because FtsZ or EzrA may have been missing from old sites of septation.

Supplementary Figure 3. Representative 3D-SIM IFM and DAPI images obtained of Spn strain IU7223 (FtsZ-Myc EzrA-HA) at different division stages. DNA (DAPI stained image) is false-colored white or blue in columns 1 or 5 , respectively. FtsZ and EzrA are pseudo-colored as red and green, respectively. The first row of each panel represents images captured in the XY plane, while second row images were obtained by rotating a section of the cell around the X or Y axis. Individual rotated daughter and/or septal rings are indicated by the corresponding arrows of the non-rotated cells.

## FtsZ-Myc EzrA-HA $\Delta m a p Z$

## Early Division

Supplementary Figure 4. Representative 3D-SIM IFM and DAPI images obtained from Spn strain IU9723 ( $\Delta$ mapZ FtsZ-Myc EzrA-HA) in early or late divisional cells (panels on left or right, specifically). DNA (DAPI stained image) is false-colored white or blue in columns 1 or 5, respectively. FtsZ and EzrA are pseudo-colored as red and green, respectively. The first row of each panel represents images captured in the XY plane, while second row images were obtained by rotating the cell around the X or Y axis.

## FtsZ-sfGFP EzrA-HT

GFP-FtsA
EzrA-HT

Supplementary Figure 5. Dual-TIRFm showing kymographs of nascent or early equatorial ring planes from time lapse experiments performed to show FtsZ with EzrA or FtsA with EzrA dynamics in Spn. Experiments were performed with strains IU15768 or IU15699 (See Supplementary Table 1 for complete genotypes). Kymographs were obtained from 180 frames, acquired at 1 frame/s intervals. Both strains were labeled with 500 nM HT-JF549 to label EzrA-HT. Scale bar is shown as the horizontal yellow bar ( $3^{\text {rd }}$ set of kymographs from the left) and indicates $1 \mu \mathrm{~m}$ in size. Magenta drawn lines going vertical are regions where EzrA is present with a lack of FtsZ or FtsA observed.

Kymographs are representative of 2 biological experiments in which greater than 5 nascent or 5 equatorial ring planes were analyzed.
A.

2D-EFm: EzrA-L-sfGFP FDAA (5 min pulse)

B.

Band widths at midcell

C. 3D-SIM EzrA-L-sfGFP FDAA pulse

Stage 1 (vertical)

Stage 2 (vertical)

Supplementary Figure 6. Organization of EzrA and PG synthesis during the cell cycle of Spn. Pneumococcal strain expressing EzrA-sfGFP as the only source of EzrA in the cell (IU10254; ezrA-sfgfp) were grown exponentially and pulse-labeled with TADA for 5 min and as described in Materials and Methods. For 3D-data, a total of between 5-10 cells per stage were analyzed. EzrA is green while FDAA labeling (TADA) is pseudo-colored red. (A) 2D-analysis of EzrA-sfGFP and FDAA labeling using IMA-GUI program as described in Materials and Methods and previously (Tsui et al., 2014). (B) Width measurement of EzrA-sfGFP rings and FDAA-rings from cells in 2D-fields. Measurements and plotting occurred as described previously (Tsui et al., 2014) (C) 3D-SIM representative images of EzrA-sfGFP rings and FDAA labeling of vertically-oriented cells.

Supplementary Figure 7. Depletion of EzrA is different ways shows EzrA is essential for Spn cell growth. Pneumococcal cells were depleted of EzrA (IU8799; $\Delta e z r A / / b g a A:: \mathrm{P}_{\mathrm{Zn}}$-ezrA ${ }^{+}$) and compared to IU1945 $\left(e z r A^{+}\right)$. Shown are representative experiments from two or more biological replicates. (A) Growth curves showing induction using different amounts of $\mathrm{ZnCl}_{2} / \mathrm{MnSO}_{4}$ increases growth rate and final cell density yield. (B) Growth curves showing EzrA is required for wild-type like cell growth and final cell density in BHI broth by changing the cell density at the initiation of depletion. (C) Depletion of EzrA-FLAG ${ }^{3}$ in IU9572 occurs similarly to depletion of EzrA ${ }^{+}$in IU8799.

## Pre-divisional cells

Supplementary Figure 8. EzrA( $S p n$ ) depletion results in shape and size aberrances. Box-andwhiskers plots (whiskers, 5 and 95 percentile) showing quantification of lengths, widths, aspect ratio (Length/Width), and relative volumes (W ${ }^{2} \mathrm{x}$ L) of EzrA depletion strain (IU8799; $\Delta e z r A / / b g a A:: \mathrm{P}_{\mathrm{Zn}}$-ezr $A^{+}$) compared to that of wild-type (IU1945; ezr $A^{+}$). Length was defined as the longer side of stage 1 cells or half of the longest axis of stage 4 cells such that the measurement is that of the daughter-cell, individually. The Width was defined as the shorter axis of stage 1 cells or at equatorial-parallel planes of stage 4 daughter cells. Volumes are relative to the median volume of wild-type cells (IU1945). The red dotted line in "Aspect ratio" and "Relative volume" indicated the median of wild-type cells. P values were obtained by one-way ANOVA analysis between WT and other samples (GraphPad Prism, nonparametric Kruskal-Wallis test). ( $\mathrm{P}<0.05$ indicated by ${ }^{*}, \mathrm{P}<0.001$ indicated by ${ }^{* * *}$ ). P values are for comparison against IU1945 (ezrA $\left.{ }^{+}\right)$.

Supplementary Figure 9. The transmembrane domain and QNR motif of $\operatorname{EzrA}(S p n)$ are required for protein function and midcell localization. (A) 2Dstructure of EzrA showing the amino acids composing the transmembrane (TM) domain and the QNR motif and schematic showing different effects of EzrA domain mutants as reported in (Haeusser et al., 2007; Land et al., 2014). In S. pneumoniae, deletion of the QNR motif or TM domain is lethal. (B) Depletion of ectopic EzrA ${ }^{+}$in $\triangle e z r A$, ezr $A \Delta \mathrm{QNR}$, or ezr $A \Delta \mathrm{TM}$ mutant backgrounds. Strains used IU1945, IU8799, IU10909, IU11123. (C) Western blots detecting EzrA-sfGFP variants (using anti-GFP) or MreC loading control (using anti-MreC) as described in Materials and Methods. $3 \mu \mathrm{~g}$ of cell lysate was loaded per lane. (D) Localization of EzrA-sfGFP variants in cells grown in the presence of $\mathrm{Zn}\left(0.5 \mathrm{mM} \mathrm{ZnCl}{ }_{2}\right.$ and $0.05 \mathrm{mM} \mathrm{MnSO} 4)$ or depleted of $\mathrm{Zn}(-\mathrm{Zn})$. Cells were imaged at $\mathrm{T}=4 \mathrm{~h}$. The strains used are indicated in the figure. The fluorescence intensity of $\operatorname{EzrA}(\Delta T M)$-sfGFP was enhanced 2 X to show localization of this protein as it demonstrated less fluorescence intensity in comparison to all other fusions shown here.

Supplementary Figure 10. Chromosome segregation defects upon EzrA(Spn) depletion. Exponentially growing cells (IU1945 or IU8799) were fixed and stained with DAPI as described in Materials and Methods. Pre-divisional or post-divisional cells were identified based on phase contrast microscopy then overlaid with DAPI and scored as nucleate (containing DAPI staining) or anucleate (lacking DAPI staining). Arrows point to anucleate cells.

Supplementary Figure 11. Depletion of EzrA(Spn) in a strain expressing FtsZ-
GFP. Growth and FtsZ-GFP localization was compared in IU8845 (FtsZ-GFP parent) or IU8908 (FtsZ-GFP in EzrA depletion background), in cells grown in BHI broth at $37^{\circ} \mathrm{C}$, see Supplementary Table 1 for full genotypes. (A) Growth curve (B) Quantitation of FtsZ-ring or aberrances in pre-divisional cells. (C) Representative images of WT or EzrA depleted cells expressing FtsZ-GFP. Experiment was performed twice with similar results.

## Supplementary Figure 12

Supplementary Figure 12. 2D-EFm of FDAA labeled EzrA-depleted (Spn) cells shows aberrant or absence of FDAA-rings in equators of future dividing cells. (A) Schematic of FDAA labeling procedure. IU8799 ( $\triangle e z r A / / b g a A:: \mathrm{P}_{\mathrm{Zn}^{-}}-e z r A^{+}$) was grown exponentially, and depleted of EzrA by shifting cells to BHI broth lacking $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$ as described in Materials and Methods. Pre-labeling with FDAA HADA (pseudo-colored blue), pulse labeling with FDAA TADA (pseudo-colored red), fixation, and imaging were performed as described in Materials and Methods with the indicated procedures at different time points. (B) EzrA depletion showing 2D representative images of FDAA labeling in EzrA depleted strain (at 1 h) with 5 minute short pulse labeling time. (C) EzrA depletion showing 2D representative images of FDAA-labeled EzrA-complemented or -depleted cells (at 2 or 3 h ) with respective short pulse labeling time indicated by values in the fifth row. Long pulse is pseudo colored green to shown better contrast. Scale bars are $1 \mu \mathrm{~m}$.

C $\Delta e z r A / / P_{\mathrm{Zn}_{n}}-$ ezrA ${ }^{+}(-\mathrm{Zn} 3 \mathrm{~h} ; \mathrm{n}=40$ cells $)$

Supplementary Figure 13. Representative 3D-SIM images of FDAA pulse-chase labeled Spn cells show EzrA depletion in strain IU8799 ( $\Delta$ ezrA//bgaA $:: \mathrm{P}_{\mathrm{Zn}}$-ezrA ${ }^{+}$) leads to major aberrances in new FDAA insertion locations. EzrA depleted cells were obtained at appropriate time points and chase labeled with TADA as indicated in Supplementary Figure 12A and in Materials and Methods. Red indicates new chase-labeling while cyan indicates pulse cell wall labeling as described in Materials and Methods. At least 30 cell were analyzed in each case (A)

Complemented EzrA strain shows normal midcell FDAA labeling and FDAA-ring labeling at equators of future dividing daughter cells (bottom rows rotated $45^{\circ}$ around the Y -axis). (B) EzrA depletion at 2 h . Top, FDAA-rings are placed at cell pole (left daughter cell) or at midcell (right daughter cell) (bottom row rotated $45^{\circ}$ around the Y-axis). Bottom, FDAA labeling displays aberrant ring-like structures (left cell) or dispersed pattern (right cell) (bottom row rotated $90^{\circ}$ around the X -axis) (C) EzrA depletion at 3 h . Top, foci of new-red and old-blue labeling (bottom row rotated 90 around the Y -axis). Bottom, FDAA-rings are placed in perpendicular planes of adjacent cells (bottom row rotated $90^{\circ}$ around the X -axis).

## no

Supplementary Figure 14. Overexpression of EzrA leads to extra Z-rings in $S$. pneumoniae. FtsZ-sfGFP was localized in IU9985 (ftsZ-sfgfp ezr $A^{+}$) or ezrA merodiploid strain IU14224 (ftsZ-sfgfp ezrA ${ }^{+} / / \mathrm{P}_{\mathrm{Zn}}$ eezr $^{+}$) cultured in $\mathrm{C}+\mathrm{Y}(\mathrm{pH} 6.9-7.1)$ media in a 5\% $\mathrm{CO}_{2}$ incubator at $37^{\circ} \mathrm{C}$. Cells were grown from $\mathrm{OD}_{620} \approx 0.003$ without supplemented $\mathrm{ZnCl}_{2}$ (no Zn ) or supplemented with $\mathrm{ZnCl}_{2}\left(0.5 \mathrm{mM} \mathrm{ZnCl}{ }_{2} \text { or } 0.25 \mathrm{mM} \mathrm{ZnCl}\right)_{2}$ ) and $\mathrm{MnSO}_{4}$ (see Materials and Methods) for 4 hours prior to imaging. Images are representative of two independent biological replicates. Arrows point to cells with extra Z-rings.

B

Supplementary Figure 15. Bactericidal effect of FtsZ(Spn) depletion and enlarged spherical cell morphology due to FtsZ-depletion. (A) Growth curve in BHI broth and corresponding quantification of $\mathrm{CFU} / \mathrm{mL}$ of FtsZ complemented or depleted cultures. Samples were obtained at $\mathrm{T}=0,1,2,3,4$, and 7 h from the WT (black line), FtsZ complemented (filled lines) or FtsZ depleted cultures (dotted lines) serially diluted where appropriate, and $5 \mu \mathrm{~L}$ of serial dilutions were spotted on blood-agar plates supplemented with $0.3 \mathrm{mM} \mathrm{ZnCl}_{2}$ and $0.03 \mathrm{mM} \mathrm{MnSO}_{4}$, and analyzed for CFU. Strains used were IU1945 (black circles), E43 ( $\Delta l y t A$ control; black diamonds), IU8124 (blue circles), and IU8810 (pink diamonds). Experiment was performed twice with similar results. (B) Box-and-whiskers plots (whiskers, 5 and 95 percentile) of cell lengths, widths, aspect ratio (Length/Width), and relative volumes ( $\mathrm{W}^{2} \times \mathrm{L}$ ) of FtsZ depletion strain (IU8124; $\Delta f t s Z / / \mathrm{P}_{\mathrm{Zn}^{\prime}}-f t s Z^{+}$) compared to that of wild-type (IU1945; $f t s Z^{+}$). Volumes are relative to the median volume of wild-type cells (IU1945). P values were obtained by one-way ANOVA analysis (GraphPad Prism, nonparametric Kruskal-Wallis test). ( $\mathrm{P}<0.05$ indicated by *, $\mathrm{P}<0.001$ indicated by ${ }^{* * *}$ ). P values are for comparison against IU1945 (ftsZ ${ }^{+}$).

Supplementary Figure 16. Localization of EzrA and FtsZ in FtsZ-depleted Spn cells shown by IFM. Strain IU7223 (ftsZ-Myc ezrA-HA) and IU8237 (ezrA-HA $\Delta f t s Z / / \mathrm{P}_{\text {Zn }}$-ftsZ-Myc) grown in BHI to mid exponential phase $\left(\mathrm{OD}_{620} \approx 0.1-0.2\right)$ and depleted of FtsZ-Myc where appropriate as described in Materials and Methods. Samples were processed for IFM with DAPI labeling of DNA as described in Materials and Methods. Texas red channel was manually increased to show FtsZMyc localization during FtsZ-Myc depletion at 1 and 2 h . Dotted boxes are indicative of additional cells that were added to show a greater number of cells in a montage format.

Supplementary Figure 17. 3D-SIM IFM shows EzrA becomes diffuse and aberrant when FtsZ(Spn) is depleted. FtsZ depletion strain IU8237 (ezrA-HA $\left.\Delta f t s Z / / b g a A:: \mathrm{P}_{\mathrm{Zn}}-f t s Z-\mathrm{Myc}\right)$, was grown exponentially, and was depleted (or complemented) of FtsZ-Myc by shifting cells to BHI broth not supplemented with additional $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$ as described in Materials and Methods. Cells were obtained at indicated time intervals and prepared for IFM as described in Materials and Methods. Experiments were performed twice with similar results. Top panel is representative of strain supplemented with $\mathrm{ZnCl}_{2}$. bottom two panels are FtsZ depleted cells at $\mathrm{T}=2 \mathrm{~h}$. "Cell orientations" are estimated cell outlines based on DAPI staining.

Supplementary Figure 18. Localization of FtsA and FtsZ in FtsZ-depleted $S p n$ cells shown by IFM. Phase-contrast and 2D IFM images of representative fields of IU10304 (FLAG-

FtsA_FtsZ-Myc) and IU11356 (FLAG-ftsA $\Delta f t s Z / / \mathrm{P}_{\text {Zn }} f t s Z-\mathrm{Myc}$ ) cells grown in the presence of $\mathrm{Zn}(+\mathrm{Zn} ; 0.3 \mathrm{mM} \mathrm{ZnCl} 2+0.03 \mathrm{mM} \mathrm{MnSO} 4)$ ) or depleted of $\mathrm{ZnCl}_{2}$ for the indicated amount of time (at $\mathrm{T}=1$ or $\mathrm{T}=2 \mathrm{~h}$ ). Data were representative of two independent biological replicates.

Supplementary Figure 19. FtsZ(Spn) is required for recruitment of FDAA labeling to equators of future dividing daughter cells. FDAA labeling in FtsZ complimented at 2 h or depleted strains (at 1, 2, or 3 h ). FtsZ depletions and processing by cell fixation for microscopy occurred as described in Materials and Methods. (A) Schematic of labeling procedure during FtsZ depletion. IU8124 ( $\Delta f t s Z / / b g a A:: \mathrm{P}_{\mathrm{Zn}}-f t s Z^{+}$) was grown exponentially, and depleted of FtsZ by shifting cells to BHI broth lacking $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$ as described in Materials and Methods. Pre-labeling with FDAA HADA (pseudo-colored blue), pulse labeling with FDAA TADA (pseudo-colored red), fixation, and 3D-SIM were performed as described in Materials and Methods as indicated in the scheme. (B) Quantification of FDAA-ring structures in FtsZ-depleted pre-divisional or post-divisional cells which were processed for FDAA labeling. Cells were classified as containing FDAA-ring or FDAA diffuse. 40 cells were sorted per biological replicate. Error bars are the SEM from two independent biological replicates. (C) Representative 3D-SIM images of FDAA labeled cells described in (B).
Each panel represents a different field of cells. Arrow points to old sites of division of stage 4 cells. More than 20 cells were analyzed via 3D-SIM per condition.

Supplementary Figure 20. 2D representative images of FDAA labeled FtsZ-depleted Spn cells. IU8124 ( $\Delta f t s Z / / b g a A:: \mathrm{P}_{\mathrm{Zn}}-f t s Z^{+}$) was grown exponentially in BHI broth in the presence of $0.3 \mathrm{mM} \mathrm{ZnCl} / 2.03 \mathrm{mM} \mathrm{MnSO}_{4}$, and was depleted of FtsZ by shifting cells to BHI broth with FDAA-HADA lacking $\mathrm{ZnCl}_{2}$ and $\mathrm{MnSO}_{4}$ for the indicated amount of time as described in Supplementary Figure 19A. The respective short pulse labeling (FDAATADA) times are indicated by values in the third row. Long pulse (FDAA-HADA) is pseudo colored green to shown better contrast. Arrows point to sites of PG syntheses between daughter cells that failed to properly localize to equatorial rings. More than 100 cells were analyzed for each condition (column).

*MpgA was formerly MItG(Spn)

Supplementary Figure 21. $\operatorname{EzrA}(S p n)$ interacts with different cell elongation and division proteins and with itself by B2H assays. EzrA interacts with FtsZ, FtsA, SepF, MapZ, StkP, GpsB, MacP, aPBP1a, aPBP2a, RodA, MreC, MreD, RodZ, MpgA (formerly MltG(Spn), DivIVA, FtsQ, FtsL, and FtsK, but apparent interactions were not detected between EzrA and FtsB, ZapA, or ZapJ. Weaker signals of interactions are detected between EzrA and bPBP2x, FtsW and bPBP2b. EzrA self-interactions are also shown. T25 or T18 fusions are expressed from lowor high-copy plasmids, respectively. Plasmid pairs pKNT25/pUT18 and pKT25-zip/pUT18C-zip were used as negative (-ve) and positive (+ve) controls. B2H assays were performed as described in the Material and Methods. The agar plates were photographed after 40 h at $30^{\circ} \mathrm{C}$. B2H assays were performed at least twice with similar results.

B. Immunostaining using anti-FtsA or anti-FtsZ

C. Immunostaining using anti-HA

Supplementary Figure 22. Co-IP western blot membranes immunostained for bPBP2B-HA, EzrA-HA, aPBP2a-HA ${ }^{4}$, FtsZ, FtsA (prey proteins) and bPBP2xFLAG $^{3}$, EzrA-FLAG $^{3}$ (bait proteins) show a lack of association between three PBPs (bPBP2x, bPBP2b, aPBP2a) and FtsZ, FtsA, or EzrA. (A) Immunostaining using anti-FLAG to show the presence of EzrA-FLAG ${ }^{3}$ and ${ }^{\text {bPBP2x-FLAG }}{ }^{3}$. (B) Immunostaining using anti-FtsZ show relatively equal amount of FtsZ in the input fractions, while FtsZ and FtsA are eluted in the presence of EzrA-FLAG ${ }^{3}$ but not bPBP2x-FLAG ${ }^{3}$. (C) Immunostaining using anti-HA show lack of association detected between EzrA with bPBP2b, bPBP2x with EzrA, and EzrA with aPBP2a. See Table 2 and Table 3 for quantitation and strain numbers.
A. Co-IP using anti-FLAG (control) Immunostaining with anti-FLAG EzrA-HA

Samples in (A) and (B) contain EzrA-HA as prey
C. Immunostaining using anti-FtsA
D. Immunostaining using anti-FtsZ

Supplementary Figure 23. Co-IP western blot membranes immunostained for EzrA-HA, FtsZ, FtsA (prey proteins) and aPBP1a-FLAG ${ }^{3}$, SepF-FLAG, and StkP-FLAG (bait proteins) show complex associations. (A) Immunostaining using anti-FLAG to show the presence of aPBP1a-FLAG ${ }^{3}$. (B) Immunostaining using anti-HA show relatively equal amount of EzrA-HA in the input fractions, while EzrA-HA is eluted in the presence aPBP1a-FLAG ${ }^{3}$. (C) Immunostaining using anti-FtsA show relatively equal amount of FtsA in the input fractions, while FtsA is eluted in the presence SepF-FLAG and StkP$\mathrm{FLAG}^{2}$, (D) Immunostaining using anti-FtsZ show relatively equal amount of FtsZ in the input fractions, while a lack of FtsZ pulled down in any eluted fraction. See Table 2 and Table 3 for quantitation and strain numbers.
A. Immunostaining with anti-Myc All strains express FtsZ-Myc

B.

Probed with antiFLAG to show presence of FLAG tagged bait proteins

Supplementary Figure 24

Supplementary Figure 24. Co-IP western blot membranes immunostained for FtsZ-Myc, FtsZ, FtsA and EzrA-HA (prey proteins) and StkP-FLAG², bPBP2xFLAG $^{2}$, aPBP1a-FLAG ${ }^{3}$ SepF-FLAG, and MapZ-FLAG ${ }^{3}$ (bait proteins) show complex associations. (A) Immunostaining using anti-Myc show relatively equal amount of FtsZ-Myc in the input fractions, while FtsZ-Myc is eluted in all fractions with the exception of no bait negative control. (B) (Left membrane) Immunostaining using anti-FLAG show the presence of bait proteins. (Right membrane) Immunostaining using anti-HA show relatively equal amount of EzrAHA in the input fractions, while EzrA-HA is eluted in the presence all proteins although to different extents. Immunostaining with anti-FtsA from eluted fractions shows different amount of FtsA eluted from each fraction. The red boxes are examples of uniform size regions that were chosen to calculate "Mean ratios" in Table 2 and Table 3. See Table 2 and Table 3 for quantitation and strain numbers used in these experiments.

A Eluted co-IP samples

Supplementary Figure 25. Co-Immunoprecipitation experiments reveal ZapA forms complexes with FtsZ, FtsA, and EzrA. Co-IP experiments were performed as described in the Materials and Methods. Data is representative of two independent biological replicates. Predicted molecular weights (MW) of proteins are; ZapA-FLAG (10kDa), FtsZ (45kDa), FtsA (46kDa), and EzrA (65kDa). (A) Blots where EzrA-HA is used as the prey. Lane 1 has non FLAG-tagged ZapA ${ }^{+}$strain as no bait negative control. Lane 2 uses ZapA-FLAG as the bait. Top panel, blot was probed with anti-FtsA primary antibody. Middle panel, blot was probed with anti-FtsZ primary antibody. Bottom panel, blot was probed with anti-HA primary antibody to detect prey EzrA-HA. (B) Blots where ZapA-HA is used as the prey. Lane 1 has untagged FLAG strain as no bait. Lane 2 uses FtsZ-FLAG as the bait. Lane 3 uses EzrA-FLAG ${ }^{3}$ as the bait. Top panel, blot was probed with anti-FtsA primary antibody. Middle panel, blot was probed with anti-FtsZ primary antibody. Bottom panel, blot was probed with anti-HA primary antibody to detect prey ZapA-HA. (C) Western blot results for the inputs for Co-IP experiments demonstrating relatively similar loading of cell lysates. Top panels indicate use of anti-FtsA primary antibody. Bottom panels indicate use of anti-FtsZ primary antibody. (D) Schematic of detected interactions. Direction of arrows indicate the ability of the protein when used as the bait to pulldown the prey protein in a complex (bait $\rightarrow$ prey). For computed mean ratios of proteins detected see Table 3.

## 3D-SIM IFM ZapA-L-FLAG FtsZ-Myc

Supplementary Figure 26

Supplementary Figure 26. 3D-Organization of Spn ZapA-, FtsZ-, and EzrA-rings assessed by 2D-ring diameter measurements and 3D-SIM IFM. Strains IU8681 (ftsZ-Myc ezrA-FLAG ${ }^{3}$ ) and strain IU10752 (ftsZ-Myc zapA-FLAG) were grown to midexponential phase in BHI broth at $37^{\circ} \mathrm{C}$ and processed for dual-protein IFM with DAPI labeling as described in Materials and Methods. (A) Scatter plot of the paired widths from the same cells of FtsZ and EzrA (left plot) or FtsZ and ZapA (right plot) fluorescent immunolabeled regions at the actively dividing septa of strain IU8681 or IU10752 at division stages 1-3 (averaged cells are shown in Figure 10B). Width measurements and plotting were done using IMA-GUI program (see Materials and Methods). Statistical analysis was performed as described previously (Tsui et al., 2014) where ${ }^{* *}$ indicates $\mathrm{P}<0.01$ and ${ }^{* * *}$ indicates $\mathrm{P}<0.001$. Septal widths of stage 4 cells were not analyzed, because FtsZ or EzrA may have been missing from old sites of septation. (B) Representative 3D-SIM IFM and DAPI images obtained of strain IU10752 at different division stages ( $\mathrm{n}=5$ per stage). Each panel is a different cell in which FtsZ, ZapA, and DAPI are localized. DNA (DAPI-stained image) is pseudocolored white (i, ii, iv) or blue (ii, v). ZapA and FtsZ are pseudocolored green and red, respectively. The first row of each image represents images captured in the $x y$ plane, while second-row images were obtained by rotating a section of the cell around the $x$ or $y$ axis, to illustrate the $z$-plane (i) Stage 1 cell showing ZapA and FtsZ-ring septal colocalization. (ii) Stage 2 cell showing ZapA and FtsZ-rings septal colocalization. (iii) Stage 3 cell showing ZapA concentrated at the septum of the cell while sparse at equators of two future dividing daughter cells. FtsZ is both at the septum and at equators of two future dividing daughter cells. Bottom panels are the right daughter cell rotated 90 degrees along the Y -axis. (iv) Late-divisional cells showing that daughter cells contain concentrated FtsZ-rings at equators of future dividing cells but sparse amounts of ZapA. A concentrated dot of ZapA at the former actively dividing septum can be seen whereas FtsZ shows a sparse dot. Bottom panels show bottom daughter cell rotated 90 degrees along Y -axis. Scale bar $=1 \mu \mathrm{~m}$. Arrows indicate equatorial ring plane that was chosen for rotation, shown in the second row of the corresponding cell.

FtsZ-L-sfGFP

Supplementary Figure 27

Supplementary Figure 27. Deletion of zapA(Spn) does not affect FtsZ treadmilling velocity or growth curve when combined with FtsZ-depletion, but $\Delta z a p A$ or $\Delta z a p J$ does show synthetic defects when combined with $\Delta m a p Z$. (A) Histogram displaying FtsZsfGFP treadmilling velocities obtained by TIRFm and kymograph analysis. Black line depicts control strain zapA ${ }^{+}$(IU9985); red line depicts $\Delta$ zapA markerless strain (IU14131). Values were obtained from two independent biological replicates. (B) Representative growth curve of FtsZ complemented or depleted cells in zapA ${ }^{+}$or $\Delta z a p A$ backgrounds. Black line indicates growth of WT (IU1945). FtsZ depletion was performed in parent cells (IU8124 $\Delta f t s Z / / \mathrm{P}_{\mathrm{Zn}}$-ftsZ ${ }^{+}$) or $\Delta$ zapA mutants IU10843 ( $\Delta$ zapA $\Delta f t s Z / / \mathrm{P}_{\mathrm{Zn}}-f t s Z^{+}$) with the indicated amount of $\mathrm{ZnCl}_{2}$. Shown are growth curve of WT cells (IU1945) or $\Delta z a p A$ mutants (E743). Experiment was performed twice with similar results. (C) Representative growth curve of Wild-type cells (IU1824), $\Delta m a p Z$
 representative from two or more independent biological replicates.

Supplementary Figure 30. Genetic loci of $\operatorname{zap} J(S p n)$ and cellular localization of ZapJ. (A)
Genetic arrangement of spd_1350 in S. pneumoniae D39 chromosome. (B) Representative images of 2D PCm and EFm of strain IU13822 (zapJ-sfgfp) grown in BHI broth at $37^{\circ} \mathrm{C}$. Scale bars are 1 $\mu \mathrm{m}$. (C) Demograph of ZapJ-sfGFP localization. Cells were grown in BHI broth at $37^{\circ} \mathrm{C}(\mathrm{n}=985)$. Data were obtained from two or more independent biological replicates.

## Supplementary Figure 31

Supplementary Figure 31. ZapJ is conserved in Streptococci. (A) Alignment of ZapJ homologs from S. pneumoniae D39 to other bacterial species. S.pneumoniae ZapJ residues (accession number WP_000808215.1) were aligned with corresponding residues of ZapJ homologs from other streptococcal species including S. mitis (YP_003446605.1), S. oralis (WP_000806743.1), S. sanguinis (WP_011837373.1), S. cristatus (WP_005591897.1), S. anginosus (WP_003023604.1), S. constellatus (WP_006268547.1), S. salivarius (WP_101772179.1), S. thermophilus (WP_011225424.1), S. downei (EFQ56587.1), S. cricetti (EFQ56587.1), S. pyogenes (WP_002985931.1), S. agalactiae (WP_001079334.1), S. mutans (WP_002262544.1), S. ratti (WP_003087037.1), S. bovis (WP_003066174.1), S. equinus (WP_004233035.1), S. suis (ABP90687.1), Species are color-coded depending on group type. Streptococcal species were chosen from each of 8 streptococci groups (Richards et al. 2014), one ungrouped streptococcal species (S. suis), and three outgroup species. Alignment was made using Clustal Omega with default parameters (Sievers et al., 2011). Species name is on left, amino acid sequence is in middle, protein length on right. Black bars designate tracts of conserved residues that may be regions of conserved function. Asterisks, identical residues; colons, conserved residues; periods, semi-conserved residues. (B) Screenshot of different zapJ genes (dark purple) encoding ZapJ orthologs in different streptococci species obtained from BioCyc website (Karp et al 2019; https://biocyc.org/). zapJ orthologs were not found in genomes of bacteria other than streptococci. The follow organisms genomes were checked but no orthologue was found: B. subtilis 168, C. glutamicum ATCC 13032, S. aureus NCTC 8325, S. coelicolor A3(2), T. denticola ATCC 35405 (GCF_000008185.1), L. lactis IL1403, E. faecalis OG1RF. murC is annotated as SPD_RS07095 in the Spn D39 genome under BioCyc.
